"CIRF-3, a new member of the interferon regulatory factor (IRF)
family that is rapidly and transiently induced by dsRNA.";

Nucleic Acids Res. 23:2137-2146(1995).

-I- FUNCTION: MAY ACTIVATE TRANSCRIPTION BY COMPLEX FORMATION WITH
OTHER TRANSCRIPTIONAL FACTORS, POSSIBLY MEMBERS OF THE STAT
FAMILY. BINDS SPECIFICALLY TO THE IFN-STIMULATED RESPONSE ELEMENT
(ISRE) BUT NOT TO THE IRF-1 BINDING SITE PRD-I.

-I- SUBCELLULAR LOCATION: NUCLEAR.

-I- SIMILARITY: BELONGS TO THE IRF FAMILY.

          TYROSINE-PROTEIN KINASE ACTIVITY.

CATALITIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.

SUBUNIT: HETERODIMER FORMED OF AN ALPHA CHAIN AND A BETA
CHAIN WHICH ARE DISULFIDE LINKED.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; ISOFORM (SHOWN HERE)
ISOFORM DELTA-RON; ARE PRODUCED BY ALTERNATIVE SPLICING. DE
LACKS PART OF THE EXTRACELLULAR DOWAIN, OLIGOMERIZES AND IS
CONSTITUTIVELY ACTIVATED.

MO1. Biol. Cell 1:337-346(1998).
-!- FUNCTION: SUPPRESSOR OF APOPTOSIS.
-!- SUBUNIT: INTERACTS WITH BLC2 AND BCL-YL.
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN
-!- TISSUE SPECIFICITY: HIGHLY ABUNDANT IN TESTIS.
-!- SIMILARITY: BELONGS TO THE BI1 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Walter L., Marynen P., Szpirer J., Le "Identification of a novel conserved Genomics 28:301-304(1995).

FUNCTION: MEMBER OF THE CYCLIN-DEPENDENT KINASE PAIR (CDK9/CYCLIN-FUNCTION) ENABER OF THE CYCLIN-DEPENDENT OF ELANGATION FACTOR B (P-TEFB), WHICH IS PROPOSED TO FACILITATE THE TRANSITION FROM ABORTIVE TO PRODUCTION ELONGATION BY PHOSPHORYLATING THE CTD (CARBOXY-TERMINAL DOMAIN) OF THE LARGE SUBUNIT OF RNA POLYMERASE (CARBOXY-TERMINAL DOMAIN) OF THE LARGE SUBUNIT OF KINASE ACTIVITY TOWARD CTD OF RNAP II AND CAN SUBSTITUTE FOR P-TEFB IN VITRO. IN VITRO, PHOSPHORYLATES RETINOBLASTOMA AND MYELLN BASIC PROTEIN.

SUBUNIT: ASSOCIATES WITH CYCLIN T TO FORM P-TEFB. ALSO ASSOCIATES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Irmler M,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated transcription factor gene which is expressed in a recombinant maturing dicot seed and which encodes a transcription factor protein which targets a promoter of a gene encoding seed storage proteins, lectins or oil-body proteins. The transcription factors isolated are Pv-Seed factor-1 (ROM1) and Vicilin-box binding protein-1 (ROM2). These factors bind to 7S-globulin (b-phaseolin) or lectin (PHA-L) promoters. The transcription factor gene is useful for enhancing or reducing expression of seed storage protein, lectin or oil-protein genes in dicot seed crops. The present sequence represents the amino acid sequence of bZIP2 (basic leucine zipper) ORF1 protein.
This invention describes novel human and mouse anti-apoptotic gene products which contain at least one death effector domain. The proof the invention are used in the treatment of HIV infections and autolumnune diseases. This sequence represents the human Herpes viru
                                                                 Claim 16;
                                                                                       New DNA encoding for anti-apoptotic infections and autoimmune diseases
                                                                                                                              WPI; 1998-532710/46.

                                                                                                                                                                                                                                                                                                                                                                                                      mammary gland cells. The invention is useful for stimulath bovine mammary gland cell growth and function, inhibiting to growth of various mammary gland cancer cells, inhibiting angiogenesis and vascularization of tunours, or modulating the growth of blood vessels in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptides and polynucleotides encoding the polypeptides, which are expressed in bovine mammary gland tissue, useful for stimulating mammary gland growth or function, or inducing differentiation of milk producing cells
                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to proteins derived from bovine mammary gland cells. The invention is useful for stimulating

Both units are necessary for the synthesis of leucine but only the second unit is required for synthesis of ile and Val. The ilvB and ilvN genes and the subunits of alpha-acetolactate synthase that they code for are claimed.
                                                                                               Streptococcus

These genomic DNA sequences encode the novel proteins given in AAY11114 to AAY11367. The proteins, isolated from Streptococcus pneumoniae, can be used in vaccines against streptococcal infections and in assays for identifying compounds that inhibit or activate the activity of the proteins. The antagonists can be used to treat an individual having need to inhibit a bacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a Streptococcus pneumoniae protein of cunknown function, and is encoded by a DNA sequence of the invention. The DNA sequences were isolated from Streptococcus pneumoniae strain collops (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and contract the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                            set proteins. A recombinant host containing a vector comprising any of the above nucleic acids can be used for the recombinant expression of the proteins. The invention also provides a DNA chip having arrayed on it at least 15 base pair fragment of any one or more of these DNA sequences. The DNA chip can be used methods for evaluating gene expression in S. pneumoniae and for identifying virulence genes in S. pneumoniae. Antibodies that selectively bind to the above proteins or peptide fragments can be used to treat S. pneumoniae, infection. The antibodies
                                                                                                                                                                                                                                                                                                                                                         from the Streptococcus pneumoniae genome and corresponding protein sequences (AAW80605 to AAW80728). The protein sequences are classified hypothetical, cell wall biosynthetic, external target, or minimal gene

sequences and/or sequences of genomic DNA encompassing complete genes portions of genes, and/or intergenic regions, collectively referred t as sequence-determined DNA fragments (Egions, collectively referred t as sequence-determined DNA fragments (From corn plants and Arabidopsis thaliana. The SDFs are promoters, structural genes, untranslated regions (UTRs), or 3' termination sequences. They can be used for expressing a gene product and controlling expression of a target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic mapping, and identification of a particular individual plant or for clustering a group pf plants with a common trait. AAA78433 to AAA7863 and AAB24605 to AAB25099 represent the specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Plant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               as sequence-determined DNA fragments (SDFs), from corn plants and Arabidopsis thaliana. The SDFs are promoters, structural genes, untranslated regions (UTRs), or 3' termination sequences. They can be used for expressing a gene product and controlling expression of a target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic mapping, and identification of a particular individual plant or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mapping, and identification of a particular individual plant or for clustering a group pf plants with a common trait. AAA78433 to AAA78630 and AAB24605 to AAB25099 represent the specifically claimed

Best Local
                                             sequences and/or sequences of genomic DNA encompassing complete genes, portions of genes, and/or intergenic regions, collectively referred to as sequence-determined DNA fragments (SDFs), from corn plants and Arabidopsis thaliana. The SDFs are promoters, structural genes, untranslated regions (UTRs), or 3' termination sequences. They can be used for expressing a gene product and controlling expression of a target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic mapping, and identification of a particular individual plant or for clustering a group pf plants with a common trait. AAA78433 to AAA78630 and AAB24605 to AAB25099 represent the specifically claimed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                          The present sequence is provided in a specification relating to nucleic CC acid molecules encoding 32 novel human secreted polypeptides. The nucleic CC acid molecules and polypeptides may be used in the prevention, diagnosis CC and treatment of diseases such as immune disorders (e.g. multiple CC sclerosis, systemic lupus erythematosus and human immuno-deficiency virus CC (HIV) infections), hyperproliferative disorders (e.g. cancers and CC Gaucher's disease), cardiovascular diseases (e.g. Scimitar syndrome, CC Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic CC disorders (e.g. corneal graft neovascularisation and diabetic CC retinopathy), neurological disorders (e.g. Huntington's chorea, CC Alphalmer's disease and Parkinson's disease) infectious diseases and/or CC acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate CC corporation of similar nucleic acid sequences in samples. The CC polypeptides may be used as antigens in the production of antibodies and cc in assays to identify modulators of their expression and activity.

                                                                                                                                                   The present sequence represents a Staphylococcus aureus protein of unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Black MT,
